Better freight decisions. Clearer trade-offs.

RouteMind AI helps planners compare shipment options and understand why a route fits.

WHAT WE ADDRESS

The business problem

A low price is not enough if the shipment arrives late or needs special care.

WHAT ROUTEMIND DOES

The solution

Describe the shipment once, then review suitable options and their trade-offs.

WHY IT MATTERS

The intended value

Make choices easier to compare, explain and revise. Benefits still need a user pilot.

Decision support for the planner.

The person makes the final choice; the application does not book the shipment.

Meet RouteMind AI

A planning assistant that helps people compare ground-freight shipment options.

THE USER

Who is it for?

Logistics coordinators deciding how to move a shipment between locations.

THE PURPOSE

What does it help with?

Compare cost, arrival time, transfers and cargo-handling needs in one place.

THE RESPONSIBILITY

Who makes the decision?

The planner reviews the options and makes the final choice. No booking is made.

Describe the need. Understand the options. Review the trade-offs.

This presentation shows the problem, the experience and how we will assess its value.

One shipment. Several competing priorities.

Planners need to understand which options meet the requirements—and what they must trade off.

COST

Stay within budget

Will the total price, including transfers, fit the spending limit?

TIMING

Arrive when needed

Can the shipment make the connections and arrive by the deadline?

CARGO CARE

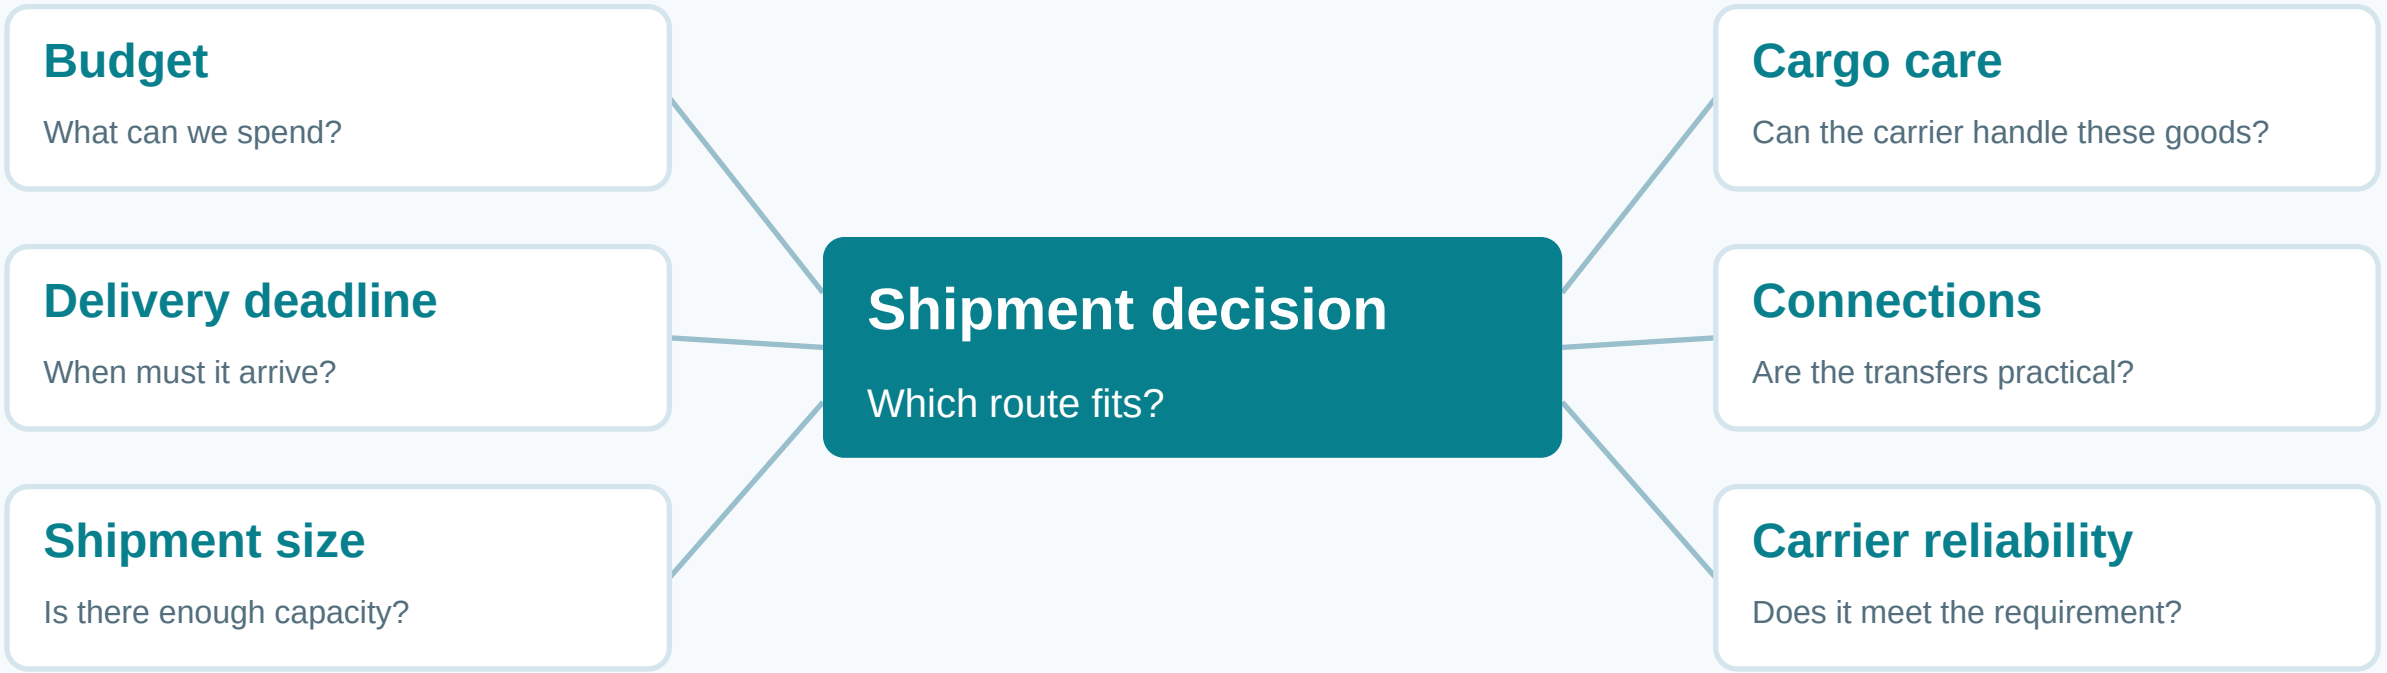

Protect the goods

Does each service have the documented handling capability and enough space?

When a requirement changes, the planner needs a clear comparison—not a fresh start.

What makes a route suitable?

The right choice depends on the shipment’s requirements—not price alone.

A change to one requirement can change the best route.

From a shipment request to a clear comparison

RouteMind organizes the planning conversation around the decision the user needs to make.

1 TELL US THE NEED

Describe what matters

Enter the locations, shipment size, spending limit and handling needs.

2 UNDERSTAND THE CHOICES

Compare suitable routes

See prices, arrival times, transfers and the reasons behind each option.

3 REVIEW THE TRADE-OFF

Explore a change

Ask for faster delivery or a different shipment size without re-entering everything.

If details are missing, it asks. If no option fits, it says so.

It does not make up an available service to satisfy the request.

Would you pay more to arrive eight hours earlier?

Example shipment: 15 pallets of fragile electronics, Fremont to Austin, with a $4,000 limit.

Choice	Route	Example price	Arrival
Lower cost	Fremont > Phoenix > Austin	$2,100	40 hours after start
Earlier arrival	Fremont > Austin (direct)	$3,400	32 hours after start

The decision: $1,300 more for arrival 8 hours earlier.

The planner decides whether earlier delivery is worth the extra cost.

Illustrative services and prices only. Arrival times use the same fixed demo start.

A conversation that keeps the shipment in context

A short demonstration can show the full experience without explaining the technology.

01

Describe

“Move 15 pallets of fragile electronics under $4,000.”

02

Review

Compare the recommended route and other suitable choices.

03

Ask

“Make it faster, but keep the budget.”

04

Decide

Review the difference, then choose the business priority.

The final decision stays with the user. No booking or capacity reservation takes place.

Ask about handling—and see the supporting information

Users can review carrier descriptions separately from the route recommendation.

“What handling is described for fragile goods?
Do the documents specify packaging requirements?”

VISIBLE EVIDENCE

Read the original passage

Open the source rather than relying on an unexplained answer.

CLEAR LIMITS

See what is missing

Unspecified details remain unanswered; missing information is not a promise.

HUMAN REVIEW

Flag a concern

Conflicting or outdated information needs review before relying on it.

A realistic workflow built on simulated information

The demonstration uses a repeatable sample network, not live carrier prices or customer shipments.

Sample information	Included in the demonstration
Locations and connections	18 US hubs with transfer rules
Transport providers	10 fictional carriers with handling capabilities
Available services	180 scheduled services with sample prices and pallet space
Supporting information	58 carrier passages, handling notes and planning examples

Before real-world use: obtain authorized, current data and clearly distinguish it from demo information.

Check the calculations. Check the experience. Validate the value.

The prototype has been tested for expected behaviour; business impact still needs to be measured.

ALREADY CHECKED

Calculations and rules

Check prices, capacity, connections, delivery limits and the final route details.

ALREADY CHECKED

User workflows

Check planning, follow-up changes, source links, error messages and mobile layouts.

NEXT TO VALIDATE

Business outcomes

Measure decision time, clarity and quality with representative users and reviewed cases.

107 software checks passed in each of two database test setups.

No proven cost savings, live-service accuracy or user productivity claim is made.

Prove the value in a small, controlled pilot

Use the working demonstration to agree what success should look like before expanding the scope.

1 DEFINE THE PILOT

Choose the cases

Use representative shipments and a small group of planners.

2 VERIFY QUALITY

Review the decisions

Have an expert check requirements, recommendations and unanswered questions.

3 ASSESS THE VALUE

Measure the difference

Compare task time, clarity and decision quality against an agreed baseline.

Management discussion: Which planning decision should we improve first, and what evidence would justify taking this beyond a demonstration?
